

My name is SFC Kevin Reagan, and I am the small arms Master Gunner for Fort Bliss TX. As the Small Arms Master Gunner for the Army Evaluation Task Force (AETF), I was fortunate enough to evaluate a number of suppressors for Light Infantry. The one thing we felt like QSM needed to fix was that their suppressors required that the birdcage be removed, in order to thread their suppressor onto the barrel. This was not practical for the "big Army". We recommended that they build the same suppressor with a quick attachment, so that the suppressors could be used from weapon to weapon, squad to squad, platoon to platoon. This is so that the suppressors could be changed out for the mission, and we could save money by not purchasing "special" birdcages. QSM has produced a magnificent suppressor to fill this roll. It is a quick attach that fits over the standard birdcage. It fits snugly and securely, doesn't rotate off, and can be removed from the weapon with ease. This suppressor maintains its rugged durability. We have now fired over 2,500 rounds through it, and it has not lost any of its effectiveness. We have also fired this suppressor on 3 round burst without the locking nut rotating at all. I highly recommend this suppressor, especially when compared to other quick attach suppressors out there right now. Please contact me for further information.
